

**2018 Texas A&M AgriLife Bushland Forage Sorghum Silage Trial**

Jourdan Bell, Ed Bynum, Ronnie Schnell, Carla Naylor,  
 Preston Sirmon, Kevin Heflin and Katrina Horn

The 2018 Texas A&M AgriLife Research and Extension Forage Sorghum Silage Trial consisted of 56 entries including forage sorghum, sorghum-sudangrass, sudangrass, and dual-purpose forage/grain sorghum hybrids. Two corn hybrids and two additional grain sorghum hybrids were included as checks. Of the 56 entries, 26 were brown midrib (BMR) forage sorghum and sorghum-sudangrass hybrids, and 13 were brachytic hybrids (Table 1). The average forage yield was 22.5 tons/acre with yields ranging from 28.6 to 16.9 tons/acre. In-season precipitation plus irrigation totaled 25.4 inches, but 7.61 inches of precipitation was received after October 1, 2018 resulting in harvest delays and lodging (Fig. 1). Precipitation after October 1, 2018 did not contribute to forage biomass production. A hail storm the evening of August 1 resulted in leaf shredding and stalk bruising. Earlier maturing varieties were in bloom or a stage of bloom at the time of the hail storm. Longer maturity classes continued to add regrowth during more favorable late August and September conditions.

**Figure 1.** In-season daily maximum and minimum temperatures and cumulative precipitation.

The trial was located near Bushland, TX with a cooperating producer (Mr. Michael Menke) under center pivot irrigation within a forage sorghum circle. Seed companies submitted forage sorghum hybrids on a per fee basis except for the grain sorghum checks and corn hybrids. Plots were planted on May 23, 2018. Hybrids were blocked according to the marketed maturity class so that plots within each maturity class block could be mechanically harvested for forage yield when grain reached soft dough, but numerous hybrids reached soft-dough at dates earlier than the maturity class in which they were blocked. Consequently, forage yield was obtained from a 25 ft<sup>2</sup> area (1 row by 10 ft.) hand-sample within each plot, and a uniform sub-sample was chopped for nutritional composition. Hybrids that had not reached soft-dough were all harvested on the last sampling date (October 24, 2018). Uniform sub-samples were collected for dry matter and nutritional composition. If possible, plants were harvested from a non-lodged portion of the plot to preserve forage quality. Lodging was recorded at harvest.

### **Agronomic Information**

Cooperator: Michael Menke

Previous Crop: Fallow

Planting Date: May 23, 2018

Seeding Rate: 75,000 seeds/acre

Herbicide: Pre-plant application of Bicep (Atrazine + S-metolachlor) 1.5 pts/ac

Insecticide: 2 applications of Sivanto (SCAs identified July 24, 2018)

Chemigation July 29, 2018 (6 oz/ac with 0.3 inch irrigation)

Aerial application August 6, 2018 (6 oz/ac at 3 GPA)

Fertilizer: Manure during fallow

In-season Irrigation: 12.75 inches applied in 0.75 inch applications

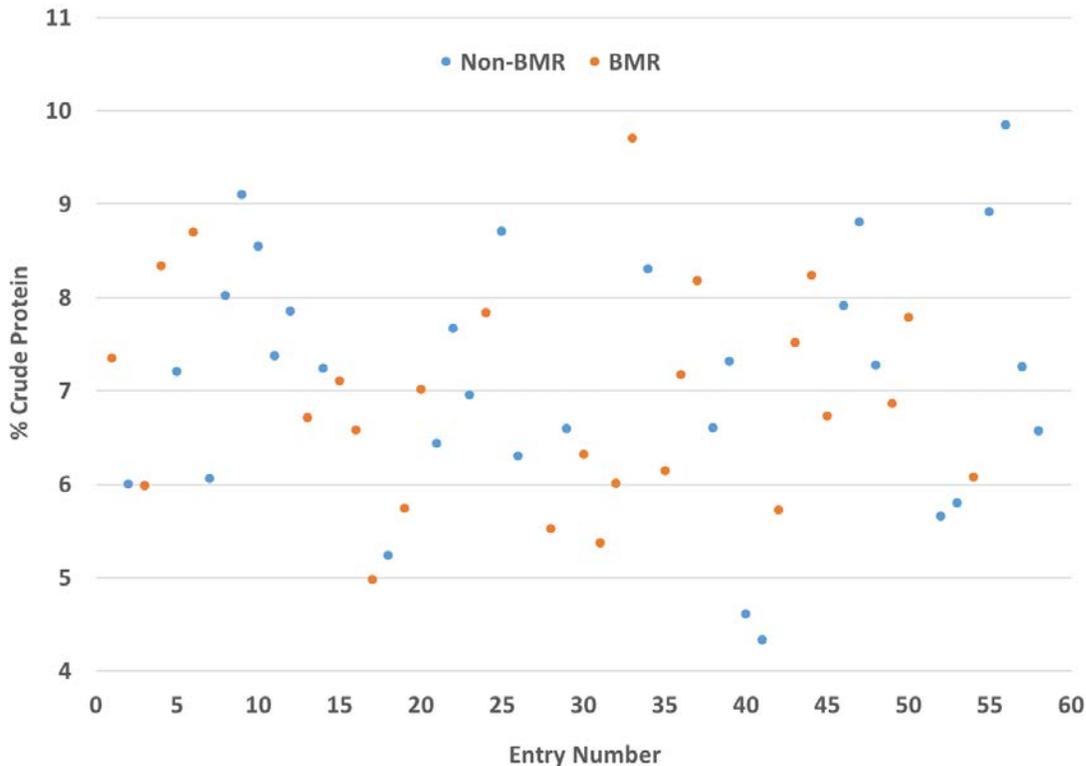

In-season Precipitation: 12.68 inches with 7.61 inches received after 10/1/2018 resulting in harvest delays and lodging; Hail Storm on evening of August 1, 2018  
Plot size: Four, 30-inch rows by 25 ft. (30ft planted)

A portion of the chopped forage was dried at 221°F (105°C) to determine harvest moisture. The remaining portion of the chopped forage was submitted to Dairyland Laboratories, Arcadia, WI for forage analyses completed using near infrared reflectance spectroscopy (NIR). Forage quality was determined for hybrids as requested by the company. Forage constituents are reported on a dry matter (DM) basis.

**Forage Analyses defined:**

<b>CP:</b>	Crude Protein
<b>ADF:</b>	Acid Detergent Fiber; a fraction of the cell wall includes cellulose and lignin, which is inversely related to energy availability
<b>aNDF:</b>	Neutral Detergent Fiber; cell wall fraction of the forage
<b>NDFD:</b>	NDF digestibility; estimated fiber digestibility after the specified length of time (48 hrs.)
<b>uNDFom:</b>	Undigested NDF after fermentation for the specified length of time (240 hrs.) expressed on an organic matter basis (om) in order to account for the ash
<b>TDN:</b>	Total Digestible Nutrients (by Weiss equation) an index of energy concentration.
<b>RFQ:</b>	Relative Forage Quality - an index for comparing forages, not just alfalfa. RFQ is based on the same scoring system as RFV with an average score of 100; higher scores indicate better feeding value
<b>Milk/ton:</b>	An index based on several variables that influence intake and nutritive value. These are applied to a standard dairy cow to project milk produced per ton of forage.

Agronomic production factors including weather, irrigation, fertility, planting population, weed management, and harvest stage can all affect forage yield potential and quality. The large scale of the Bushland trial provides producers and nutritionists the opportunity to compare forage yield and quality parameters for multiple forage sorghum types under the same production environment. The inclusion of corn checks also provides the ability to compare forage sorghums to select corn hybrids in the same production environment. It is not recommended that hybrid selection be made based on marketed forage type. While the marketed forage types provide an indication of potential quality, actual quality parameters vary for hybrids of the same forage type. An evaluation of the % crude protein (CP) for 2018 forage sorghum entries by BMR trait demonstrated negligible difference between the broad averages between BMR and non-BMR hybrids with significant in-type variation (Fig. 2). Because forage quality requirements vary between livestock class and ration formulation, evaluated parameters provide a broad comparison of forage quality in the respective production environment (Table 1).

**Figure 2.** Evaluation of % Crude Protein for BMR and non-BMR hybrids in the 2018 Texas A&M AgriLife Forage Sorghum Silage Trial.

Sugarcane aphid infestations (SCA) became wide spread in late July, which was approximately one month earlier than in 2017. Due to the heavy infestation, the entire field including our test plots was chemigated with Sivanto at 6 oz/ac (0.3 inches of irrigation) on July 29, 2018. Because high numbers of SCA colonies were still located throughout the field after our insecticide application, all plots were rated for SCA infestation and damage using the High Plains Texas A&M AgriLife Rating scale on August 1. The reported ratings are the average of the three replications for each hybrid (Table 5). Maximum infestation occurred on August 1 with damage ratings levels ranging from a low of 2.7 to a high of 6 (which is equivalent to 50% or more of the leaf area infested or damaged) (Table 5). Due to the levels of infestation and potential for significant yield loss after the first application, a second 6 oz/ac aerial application (3 GPA) was applied on August 6, 2018. Subsequent ratings from August 15 to September 12 are reported in Table 5. The second application provided excellent control of the SCAs and damage levels declined from very low levels to no damage. The decline in damage was due to sorghum hybrids continuing to put on new growth that was not damaged from SCAs. This new growth allowed the sorghum hybrids to outgrow any initial SCA damage and prevented any significant yield loss. This demonstrates that timely insecticide applications to control SCA infestations will protect forage sorghums. In addition to two insecticide applications, beneficial insects, predominately lady beetles and syrphid fly larvae, were observed throughout the trial. Due to the presence of beneficial insects present in the 2018 trial, it is reasonable to believe that

beneficial insects were providing biological control. However, without the insecticides applications the beneficial insects alone would not have been able to prevent yield losses.

**High Plains Texas A&M AgriLife Sugarcane Aphid Rating Scale:**

- 0: no aphids or honey dew found
- 1: 10% of leaf area infested or damaged, colonies establishing on lower leaves or some honey dew visible on 2 or less leaves
- 2: 11-20% of leaf area infested or damaged
- 3: 21-30% of leaf area infested, damaged or dead
- 4: 31-40% of leaf area infested, damaged or dead
- 5: 41-50% of leaf area infested, damaged or dead
- 6: 51-60% of leaf area infested, damaged or dead
- 7: 61-70% of leaf area infested, damaged or dead
- 8: 71-80% of leaf area infested, damaged or dead
- 9: 81-90% of leaf area infested, damaged or dead
- 10: 91% of leaf area damaged to dead

Grain yield was collected in November following forage harvest for select hybrids upon seed company request at the time of entry. Grain yields were reported to the USDA-Risk Management Agency to update the Loan Deficiency Payment Tables for forage sorghum hybrids (Table 6). Statistical analyses were completed using SAS 9.4. Adjusted least significant differences for multiple comparisons were determined using Tukey's HSD. Effects and comparisons were determined significant at the 0.05 probability level. The discussion above addresses broad averages for types of forage sorghums, grain sorghums evaluated as silage, and sorghum/sudangrass hybrids evaluated in the 2018 test. We recommended individual hybrids not be selected or disregarded based on the sorghum type nor based on the relative comparison among types. There is overlap among hybrids in these type categories. It is recommended to evaluate the data based on the individual hybrid, not the forage type category.

## List of Tables

<b>Page</b>	<b>Table</b>
7.....	1. 2018 Summary of yield, lodging, and quality (DM basis) by forage type. The number in parentheses represents the number of hybrids that make up each sorghum type.
8.....	2. 2018 Mean yield, days to half-bloom, lodging, and harvest moisture listed in alphabetical order by company. Hybrid characteristics were provided by seed companies. Male sterile entries were pollinated by other hybrids. FS=Forage Sorghum, SS=Sorghum Sudan, SU=Sudangrass, GS=Grain Sorghum
9.....	3. 2018 Mean yield, days to half-bloom, lodging, and harvest moisture by maximum yielding hybrids. Male sterile entries were pollinated by other hybrids. FS=Forage Sorghum, SS=Sorghum Sudan, SU=Sudangrass, GS=Grain Sorghum
10.....	4. 2018 Summary of nutritional composition reported on a dry matter (DM) basis and calculated quality indices with forage yield. Hybrid characteristics were provided by seed companies. Male sterile entries were pollinated by other hybrids. FS=Forage Sorghum, SS=Sorghum Sudan, SU=Sudangrass, GS=Grain Sorghum
12.....	5. 2018 Sugarcane aphid ratings and the seasonal aphid rating. Means followed by the same letter do not significantly differ using LSD (0.05).
13.....	6. 2018 Grain yields reported for FSA to update Loan Deficiency Payment Tables as requested at the time of entry to the trial. Grain yields for all hybrids evaluated as a percent of the trial's long-term grain sorghum check Pioneer 84G62. (2018 84G62 yield: 7154 lbs/acre; 9 year avg: 8005 lbs/acre)

**Table 1.** 2018 Summary of yield, lodging, and quality (DM basis) by forage type. The number in parentheses represents the number of hybrids that make up each sorghum type.

<sup>§</sup> Due to the need to initiate harvest prior to the plot tour and issues getting field equipment into plots, all plots hand harvested (1 Row x 10 ft.). Early season heat and drought resulted in variability across field. Hail storm on August 1 had greater impact on earlier maturing hybrids; longer maturity classes continued to add new growth. Hybrids harvested after 10/5/2018 were prone to lodge as a result of October precipitation and weather. *Mean of only sorghum hybrids † If no HB date, hybrid did not reach HB prior to the last harvest date.											<b>Mean</b>	<b>22.4*</b>

§ Due to the need to initiate harvest prior to the plot tour and issues getting field equipment into plots, all plots hand harvested (1 Row x 10 ft.). Early season heat and drought resulted in variability across field. Hail storm on August 1 had greater impact on earlier maturing hybrids; longer maturity classes continued to add new growth. *Mean of only sorghum hybrids											<b>Mean</b>	<b>22.4*</b>
											<b>CV (%)</b>	<b>16.2</b>
											<b>p-val</b>	<b>0.0273</b>

**Table 4.** 2018 Summary of forage nutrient composition reported on a dry matter (DM) basis and calculated nutritional quality indices. Male sterile entries were pollinated by other hybrids. FS=Forage Sorghum, SS=Sorghum Sudan, SU=Sudangrass, GS=Grain Sorghum
